

Work procedure for KYB onboarding (SOP-10)

Company	Mynta AB
Last approval date	2026-09-10
Approved by	MLRO
Document type	Work procedure
Document owner	Head of Onboarding
Information class	Open internally, confidential externally

Versioning

DATE	VERSION	SECTION	CHANGES	BY
2026-09-07	1.0	All	Initial version	Head of Onboarding
2026-09-09	1.2	S4.5	Bolagsverket reporting rule added after legal review	Head of Legal & Compliance
2026-09-10	2.0	All	Rewritten in plain language. No rules changed.	Head of Onboarding

1 · Purpose and scope

Know Your Business ("KYB") means the checks Mynta AB ("Mynta" or "the company") performs on companies and other legal persons before they become customers. This work procedure describes those checks step by step. It implements the customer due diligence requirements in the AML/CTF policy (GOV-02) and the risk decisions in the business-wide risk assessment (GOV-01) and the risk appetite (GOV-04).

It applies to every legal person that applies for any Mynta product. This includes merchants applying for acquiring and business customers requesting the Crypto Service through Mynta Digital AB. It does not cover private individuals (SOP-11), ongoing due diligence (SOP-22) or termination of business relationships (SOP-23).

All steps in section 6 are mandatory unless a step states its own trigger. No product may be activated before the section 6 procedure is finished and the file is approved at the correct level.

2 · Legal and regulatory basis

This work procedure is based on the following.

- Lag (2017:630) om åtgärder mot penningtvätt och finansiering av terrorism (the "AML Act"), in particular chapter 3 on customer due diligence.
- Lag (2017:631) om registrering av verkliga huvudmän, including the duty to report incorrect register information to Bolagsverket.
- Finansinspektionen's regulations FFFS 2017:11.

- The EBA Guidelines on customer due diligence and ML/TF risk factors (EBA/GL/2021/02).
- Regulation (EU) 2023/1113 on information accompanying transfers of funds and certain crypto-assets, where the Crypto Service is requested.
- From 10 July 2027, Regulation (EU) 2024/1624 (AMLR). SOP-25 tracks its requirements against this work procedure.

In some places this work procedure is stricter than the law. One example is rule C-1 on how recent registry evidence must be. Where that happens, the stricter standard applies. It is a Mynta requirement, not a legal requirement.

3 · Abbreviations and definitions

TERM	MEANING IN THIS WORK PROCEDURE
Beneficial owner ("UBO")	A natural person who ultimately owns or controls more than 25% of the customer, directly or indirectly, or who controls the customer in another way. Assessed under S4.2.
Senior managing official	The person who may be recorded as beneficial owner when no UBO can be identified, but only under the conditions in S4.3.
Ownership structure	Every company and legal arrangement between the customer and the natural persons who own it, at every level.
Registry evidence	An extract from the official company registry of the relevant country. It must meet the age rule in C-1.
Discrepancy	Any disagreement about an ownership fact between the customer's declaration, the beneficial-ownership register and the registry evidence.
Complete file	All items in Appendix A are present and readable, and the registry evidence meets C-1.
PEP	Politically exposed person under the AML Act, including family members and known close associates. A former PEP is treated as a PEP for 18 months after leaving the position.

4 · Roles and responsibilities

ROLE	RESPONSIBILITY IN THIS WORK PROCEDURE
Onboarding analyst	Performs steps S1 to S6, writes the assessment, and decides low-risk files per C-6.
Senior analyst	Decides medium-risk files. Receives S4.5 escalations. May decline where this work procedure permits it.
MLRO	Decides high-risk files and all PEP relationships. Owns deviations (section 12). Approves this work procedure.
Screening function	Performs SOP-12 screening on referral from S5. Decides on hits per C-4.
Second reviewer	Performs the second review in section 13. Never the same person as the deciding analyst.

Decision levels follow rule C-6. Low risk: the analyst decides. Medium risk: the senior analyst decides. High risk and all PEP relationships: the MLRO decides. No one at any level may deviate from the prohibited list; only the board can change it, through GOV-04.

Two limits apply at every level. A file with an unresolved S4.5 discrepancy, or an incomplete S4 ownership structure, cannot be approved by anyone. The same file cannot be declined below senior-analyst level (S7.1).

5 · Entity types and required documents

The document set depends on the customer's legal form and country. The table below is the minimum. The risk rating (S6) can require more through SOP-13. "Registry extract" always means evidence that meets C-1: under 6 months old at onboarding.

ENTITY TYPE	IDENTIFICATION AND CONSTITUTION	OWNERSHIP EVIDENCE	REPRESENTATIVES
Swedish aktiebolag (AB)	Bolagsverket registreringsbevis (e-extract accepted); bolagsordning on request	Aktiebok (share register); Bolagsverket beneficial-ownership register entry	Registered signatories per extract; ID per section 7
Handelsbolag / kommanditbolag	Bolagsverket extract; bolagsavtal where ownership is unclear from the extract	Partner list; beneficial-ownership register entry where applicable	Partners with signing rights; ID per section 7
Enskild näringsidkare	Bolagsverket/Skatteverket registration	Not applicable; the proprietor is the customer, identity handled with SOP-11 standards	The proprietor
Ekonomisk förening	Bolagsverket extract; stadgar	Member structure summary; beneficial-ownership register entry; control assessed on the voting rules	Board per extract; ID per section 7
Stiftelse (foundation)	Länsstyrelsen register extract; stiftelseförordnande	Founders, board and any beneficiaries identified as controllers; register entry	Board or administrator; ID per section 7
EEA company	Official national registry extract; constitutional document where ownership rules matter	Share register or equivalent; national BO register extract where the country provides one	Signatories shown by extract or notarised power of attorney; ID per section 7
Non-EEA company			

	Official registry extract; legalisation (apostille or consular) applied risk-based per section 7.2 where issued as a certified paper copy	Share register certified per section 7; structure chart signed by a director; BO evidence per the local rules	Notarised and legalised power of attorney where authority is not on the extract; ID per section 7
Listed company (regulated market, adequate disclosure) and its majority-owned subsidiaries	Extract plus evidence of the listing	Simplified: section 9 applies; UBO identification may rely on listing disclosures	Signatories per extract or power of attorney; ID per section 7
Public body	Constituting statute or register evidence	Simplified per section 9	Authorised officials; ID per section 7

5.1 Guidance per entity type

Swedish AB. The registreringsbevis proves that the company exists and who signs for it. It says nothing about ownership. The ownership evidence is the aktiebok, and the customer produces it. Because of that, the analyst shall check it against the beneficial-ownership register entry. Where the ownership structure continues upward, the analyst shall also obtain registry evidence for each holding company. Watch for one pattern: a newly formed AB (under 12 months) that expects immediate high volumes. That is not reasonable on its face, and S3.2 applies.

Handelsbolag and kommanditbolag. Partners are jointly liable. Each general partner is treated as having control, regardless of profit share, unless the bolagsavtal shows otherwise. The kommanditdelägare's capital share still counts toward the 25% calculation.

Ekonomisk förening. Ownership rarely concentrates in a förening, but control can. Assess the voting rules in the stadgar, any rights to appoint board members, and any dominant member. The senior-managing-official option is common here. That is correct when the S4.3 conditions are met.

Stiftelse. A foundation has no owners, so beneficial ownership follows control and benefit. Look at board members or administrators with decisive influence, founders who kept rights for themselves, and identifiable groups of beneficiaries. Foundations applying for acquiring are rare. When it happens, the file goes to SOP-13 on the complex-structure trigger.

EEA companies. Registry quality varies between countries. In many of them the national register does not show shareholdings. In that case the share register comes from the customer, and it must be checked one level further up against registry evidence. National BO registers are used where they exist. They are filings, not proof, exactly as in Sweden.

Non-EEA companies. The legalisation matters as much as the document itself. An apostilled certified copy of a share register proves the copy as at its issue date, so the C-1 age rule applies to that issue date. Countries in the C-2 high-risk category always add the SOP-13 route.

Listed companies. The simplification covers the ownership evidence only. It applies only while the listing is verified as current, on a regulated market with adequate disclosure requirements. An MTF listing does not qualify. For a majority-owned subsidiary, the majority link must be documented. Group membership stated by the customer is not enough.

Trusts and comparable foreign legal arrangements are outside Mynta's risk appetite for acquiring, per GOV-04. As account customers they require MLRO pre-approval before S1 begins. The trustee, settlor, any protector and the beneficiaries must all be identified, and the file always goes to SOP-13.

6 · Procedure

S1 · Intake and completeness

S1.1 Receive the application. It must contain: the onboarding form; the UBO declaration (template T-1); an ownership chart drawn by the customer; a registry extract for the applicant meeting C-1; the share register or equivalent per section 5; identity documents for the signatories; a description of the business and the purpose of the relationship; expected products, volumes and counterparty countries; and, for acquiring, the MCC, the transacting website and any processing history.

S1.2 Check completeness against Appendix A within 2 business days of receipt. IF any item is missing, unreadable or too old under C-1, THEN request the item, record the request, and pause the assessment clock. Do not begin the assessment on an incomplete file. If quality control finds conclusions drawn on an incomplete file, that is recorded as a finding.

S1.3 Check the applicant's stated business against the GOV-04 prohibited industries and structures. For acquiring, also check the C-7 list. IF the business is prohibited, THEN decline per S8.3. No one at any level may make an exception (C-6).

S1.4 Record the target decision date: 10 business days from a complete file for standard cases. Where EDD applies, the SOP-13 timelines apply instead.

S2 · Identification and verification of the customer

S2.1 Verify that the customer exists: exact registered name, legal form, registered address and registration number, against the official registry for the country, using the section 5 table. The extract must meet the C-1 age limit. An older extract counts as missing.

S2.2 Identify the natural persons acting for the customer. Verify their identity per section 7. Verify their authority against the extract, or against a power of attorney meeting section 7. IF authority cannot be established from registry evidence or a valid power of attorney, THEN the file is incomplete. Return to S1.2.

S2.3 Record any trading names, group membership and licences relevant to the stated business. Example: gambling or MSB licences, where C-7 makes permission conditional on a licence.

S2.4 Establish the actual place of business where it differs from the registered address. Virtual-office registrations are common and legitimate, but the operating address feeds the risk rating and, for acquiring, the website checks in Appendix D. IF no operating presence can be established anywhere, THEN record this as a C-9 complex-structure indicator.

S2.5 Record the extract references and dates, the verification outcome for each person, and any authority documents relied on. For S2 as a whole: existence, identity and authority must each rest on evidence meeting section 7.

S3 · Purpose and nature of the relationship

S3.1 Record the business model, the reason for seeking the relationship, the expected products, expected monthly volumes and average transaction sizes per product area, counterparty countries,

and settlement currencies. For acquiring: open the website and verify that it exists, that it sells what the application states, and that it matches the declared MCC. The profile recorded here becomes the baseline that transaction monitoring (SOP-18) works against.

S3.2 IF the stated profile is not reasonable against the company's size, age, sector or evidence (for example, expected volumes with no trading history behind them), THEN treat this as a discrepancy. Document it and apply S4.5 in the same way: escalate. Do not resolve it by assumption.

S3.3 Record the expected counterparties by type and country: payers, payees, marketplaces, and any PSP relationships elsewhere. For the Crypto Service, record the expected split between crypto activity and account activity. These fields are mandatory even when the customer's answer is "none yet". An empty expectation is still a monitoring baseline.

S4 · Beneficial ownership

S4.1 Obtain the customer's UBO declaration (T-1) and the customer's entry in the beneficial-ownership register. Treat both with the same caution. The declaration is a claim to be verified. The register entry is the customer's own filing, so it is verified too, not relied on.

S4.2 Identify every natural person whose direct and indirect holdings add up to more than 25% of ownership or control. The calculation crosses every level: for each intermediate company, attribute its holding to that company's owners in proportion, and add up per natural person across all paths. Control in other ways also counts toward beneficial ownership regardless of shareholding: voting agreements, the right to appoint or remove a majority of the board, or comparable arrangements. IF the customer is high risk, THEN document the ownership structure from 10% instead, per rule C-3.

S4.3 The senior-managing-official option may be recorded as beneficial owner only when two things are both true: the ownership structure is fully mapped with registry evidence meeting C-1 at every level, and no natural person meets the S4.2 test. An unmapped structure never qualifies. A structure supported only by too-old documents, or only by documents the customer produced, never qualifies either.

S4.4 Verify the identity of each beneficial owner identified in S4.2, with identity evidence per section 7. Verify every ownership link with registry evidence per C-1 and section 5. A chart drawn by the customer is never enough on its own. It must be checked against registry evidence.

S4.5 IF the declaration, the register entry and the registry evidence disagree on any ownership fact, THEN stop. Do not proceed, and do not decline. Escalate to a senior analyst per SOP-19 with a discrepancy memo per template T-2. The memo contains: the recalculated ownership structure with sources, the specific discrepancy, and the requests needed to resolve it. Where the recalculated, documented ownership contradicts the register entry, report this to Bolagsverket without delay under 3 kap. 5 § lagen (2017:631) om registrering av verkliga huvudmän. Do not wait for the customer's response. Record the report and its date in the memo. The customer is told only that additional review is ongoing (S8.2).

S4.6 Document the final ownership structure: every natural person over the threshold, every intermediate company with its country and percentage per path, the evidence for each link, and the calculation. The standard is simple: a reviewer must be able to repeat the arithmetic without asking the analyst anything.

S4 guidance · Calculating total ownership

The method is proportional calculation through the ownership structure. For each intermediate company, multiply the customer's holding in it by each owner's holding in the intermediate. Do this level by level, and add up per natural person across all paths.

Mynta does not count an intermediate's holding in full once a person controls that intermediate, for the 25% arithmetic. But control in other ways is assessed separately under S4.2, and it can establish beneficial ownership on its own. Where the arithmetic lands a person just under 25% while that person plainly controls the structure, the control test decides, and the file documents why.

Worked example 1, one indirect path. Customer: 24% held directly by person A; 32% held by Holdco H; H is 78% owned by A. A's total: $24\% + (32\% \times 78\%) = 24\% + 24.96\% = 48.96\%$. A is a beneficial owner. A declaration naming no beneficial owner is false, and S4.5 applies.

Worked example 2, several paths. Customer: 15% direct by person B; 40% by Holdco X, where B owns 60% of X; 20% by Holdco Y, where B owns 30% of Y. B's total: $15\% + (40\% \times 60\%) + (20\% \times 30\%) = 15\% + 24\% + 6\% = 45\%$. Every path counts, however small its contribution. A path may be left uncalculated only when it mathematically cannot reach a contribution that matters, and that is documented.

Worked example 3, the official option correctly used. Customer: four unrelated holders at 24% each, plus 26% held by Holdco Z, owned equally by three unrelated persons (8.67% each). The highest total is 24%. No person meets the threshold, and no control arrangement exists. The structure is fully mapped with C-1 evidence at every level. So S4.3 permits recording the senior managing official, with the calculation filed.

Recording standard. File the calculation as a table: person, path, arithmetic, total, and the evidence reference per link. Round to two decimals. Thresholds are strict: "more than 25%". Where voting rights differ from capital, calculate a parallel table on voting rights, and the higher result governs.

Common failures found in quality control. Stopping at the first registry level. Accepting the customer's chart as the ownership structure. Calculating only the largest path. Treating a too-old foreign extract as good enough because the Swedish extract is fresh. Recording the official option while the structure is still unmapped, "pending documents". Each of these is recorded as a section 13 finding.

S5 · Screening

S5.1 Screen per SOP-12: the customer, every beneficial owner identified under S4, every signatory and director, and every intermediate company in the ownership structure. Screening runs on identified persons, not declared ones. A person identified by the S4 analysis is screened even if the customer never declared them. Screening beyond the required population is personal-data processing without an automatic legal ground: it requires control indications or an approved deviation, and is never run just to be safe.

S5.2 Decide on matches per SOP-12 and C-4. A near-match may be dismissed at analyst level when the identifier evidence is strong enough: one strong mismatch, such as date of birth against a verified document, may be sufficient, while two weak mismatches may not be. The assessment is recorded. IF a sanctions match is confirmed, THEN SOP-21 applies immediately, this procedure is suspended, and the customer is not notified.

S5.3 Run adverse-media screening on the customer and the identified UBOs per SOP-12. Findings in the C-9 designated categories trigger SOP-13.

S5.4 File the screening evidence per person: the lists screened, the date, the vendor reference, every hit with its decision and reason, and any screenings not yet performed marked as pending. The standard: the screening status of every identified person must be readable in one place. A file that fails this cannot meet the S7.2 documentation standard.

S6 · Risk rating

S6.1 Rate the customer per SOP-14. The rating must agree with GOV-01. A factor rated high in GOV-01 cannot produce a low customer rating here, unless the MLRO approves a documented override and it is logged in the deviation register.

S6.2 IF any C-9 trigger is present, THEN go to SOP-13 before any decision. The C-9 triggers are: any PEP; a connection to a high-risk country per C-2; an ownership structure of three or more levels, or any foreign legal-arrangement level; expected crypto turnover above 30% of volume; and designated adverse media. EDD depth follows the risk rating. Section 8 applies to PEPs.

S6.3 Record the rating inputs and the arithmetic per SOP-14, so the score can be repeated: the factor values, the weights applied, the resulting rating, and any override with its MLRO approval reference. A rating stated without its inputs is recorded by quality control as a finding.

S7 · Decision

S7.1 Decide: approve, decline, or escalate, at the level set by C-6. Two limits apply. A file with an unresolved S4.5 discrepancy or an incomplete S4 ownership structure cannot be approved at any level. The same file cannot be declined below senior-analyst level. Unresolved ownership is escalated, not declined, because a decline on a false declaration may itself require SOP-20 assessment.

S7.2 Record the decision reasons so that a reviewer can follow them from the file alone: the facts relied on, their sources, how each open item was resolved, and the rating arithmetic. Plain text is acceptable. Conclusions without references are not.

S7.3 Communication standards. Approvals state which products are activated and which information duties the customer has accepted. Declines follow S8.3. Escalations follow S8.2. No decision communication ever mentions screening outcomes, suspicion, reporting, or the internal steps of this work procedure.

S8 · Outcomes and handover

S8.1 On approval: activate only the products applied for. Set the monitoring baseline from S3.1. Schedule the periodic review per SOP-22 by risk rating: high 12 months, medium 24, low 36. File the record per section 11.

S8.2 On escalation: SOP-19 owns the case until it is resolved. The customer is told only that review is ongoing. Nothing that could reveal suspicion is shared, per SOP-20 and meddelandeförbudet.

S8.3 On decline: communicate the decision without revealing screening results, suspicion or internal assessments. Assess whether the attempted relationship must be reported per SOP-20. Record the decline and its grounds. Add the entity to the internal declined register, which is checked at S1.

7 · Verification standards

7.1 Natural persons

Swedish residents: BankID. Everyone else: passport or EEA national ID card, through the identity vendor's document-and-liveness flow. Where remote verification fails twice, a certified copy of the identity document per 7.3 is required instead. Representatives, signatories and UBOs are all verified to this standard. There is no lighter standard for "contact persons" who in fact act for the customer.

7.2 Registry and corporate documents

Swedish documents: electronic extracts directly from Bolagsverket are preferred, and accepted without certification. Foreign documents: official registry extracts in Swedish, English, Danish or Norwegian are accepted as issued. Other languages require a certified translation of the operative parts. Non-EEA documents issued as paper certified copies must be legalised: apostille, or consular legalisation where the issuing country is outside the Hague Rule.

7.3 Certified copies and powers of attorney

Legalisation of non-EEA documents is applied risk-based: required where document risk or the issuing country's risk category warrants it, and always for high-risk-category countries; the analyst records the assessment either way. Certification is accepted from a notary public, a licensed attorney, an EEA-licensed credit institution, or a Swedish embassy or consulate. The certifier's name, capacity and date must appear on the document. A power of attorney must be specific to the relationship, or clearly cover it. It must be signed by persons whose own authority is documented. For non-EEA issuers it must be legalised per 7.2.

7.4 Documentation standards

Every evidence item is filed with its source, its retrieval or issue date, and the analyst's note of what it proves. Screenshots of registries are acceptable only as working copies, and only where the registry provides no export. The URL and timestamp must be captured.

7.5 Registry evidence by common country

This table is the reference for the countries Mynta sees most in ownership structures. For a country not listed, the analyst identifies the official registry and applies 7.2. If no official registry can be identified, record that as a C-9 indicator.

COUNTRY	REGISTRY	EVIDENCES	NOTES
Sweden	Bolagsverket	Existence, form, signatories; BO register entry separately	E-extract accepted uncertified; the aktiebok remains customer-produced
Denmark	CVR / Erhvervsstyrelsen	Existence, management, registered owners over thresholds	Ownership data usable as support, not as sole proof
Norway	Brønnøysundregistrene	Existence, roles	Shareholder data via Skatteetaten lists lags; check against a second source

Finland	PRH	Existence, signatories	BO register access restricted; customer extract plus a second source
Estonia	e-Business Register	Existence, management, shareholders for OÜ	Shareholder data current and reliable for OÜ; the extract date still governs C-1
Germany	Handelsregister	Existence, representation	The Gesellschafterliste evidences GmbH ownership; obtain the filed list
Netherlands	KVK	Existence, officers	UBO register extract restricted; customer-obtained extract accepted with a second source
United Kingdom	Companies House	Existence, officers, PSC register	Filings are not verified at source; treat PSC data like a declaration and verify the level that decides the outcome
United States	State registries	Existence, agent	Ownership rarely public; certified share register per 7.3 plus an officer certificate

7.6 Document authenticity checks

For customer-supplied documents the analyst checks four things, and records having checked them: dates are internally consistent; names and numbers agree with the registry evidence; the document looks intact (no mismatched fonts, misaligned stamps or edited fields); and the issuer can be verified (registry reference numbers resolve, the certifier is identifiable per 7.3). Suspected manipulation is never handled by asking the customer for a better copy first. The document is preserved, the file escalates, and SOP-20 relevance is assessed.

8 · PEPs within KYB

The positions in scope follow the AML Act: heads of state and government; ministers and deputy ministers; parliamentarians; members of the governing bodies of political parties; supreme and constitutional court judges; senior officials of auditing authorities and central banks; ambassadors and chargés d'affaires; senior armed-forces officers; and members of the administrative, management or supervisory bodies of state-owned enterprises. At international organisations: directors, deputy directors and board members. Family members are: spouse or partner, children and their partners, and parents. Known close associates are: a person with joint beneficial ownership together with a PEP, and a person who is sole beneficial owner of an entity known to exist in practice for a PEP's benefit.

Where any beneficial owner, signatory or director is a PEP, a family member of a PEP, or a known close associate, four things follow. The relationship is high risk, without further assessment. SOP-13 source-of-wealth and source-of-funds measures apply to the PEP's interest in the customer. Approval is given by the authorised senior decision-maker the governance framework designates. Enhanced ongoing monitoring is set per SOP-22. A person who stopped being a PEP within the last 18 months is still treated as a PEP, and longer where the relationship remains high risk. PEP status

discovered after onboarding is handled under the SOP-22 event triggers, not under this work procedure.

The process. PEP status is established in two ways: through SOP-12 screening at S5, and through the direct question on T-1. A "no" on T-1 combined with a screening hit is a discrepancy, handled the S4.5 way. On confirmation: the file becomes high risk immediately. SOP-13 opens, with source-of-wealth and source-of-funds measures in proportion to the PEP's interest. The evidence must be documents, not a story: employment and mandate history, disclosed asset registers where public, and sale or inheritance documents for the capital in question. The decision is recorded in Kompas before anything is communicated. Monitoring is set to the enhanced profile in SOP-22. Where the PEP connection sits on a minority owner, below every threshold and without control, the analyst documents why that person does not drive the relationship's risk. The decision requirement still applies. Removing PEP treatment after the 18-month period is an SOP-22 event. It is assessed. It is never automatic.

9 · Simplified measures

Simplified due diligence may be applied only where GOV-01 supports low risk, and only for two customer types: a company listed on a regulated market with adequate disclosure requirements, or its majority-owned subsidiary documented as such; and a Swedish public body. Simplification means two things: reduced ownership evidence per the section 5 table, and standard rather than enhanced verification depth. It never means skipping screening (S5). It never means skipping the purpose assessment (S3). It never means skipping the risk rating (S6). Simplified files remain in the section 13 quality control selection.

Qualification is verified, not taken on trust. The listing is checked against the exchange's own register, and the evidence is filed. For non-EEA markets, the analyst assesses whether the market is regulated and the disclosure rules adequate, and records the assessment. Majority ownership by the listed parent is documented by the parent's own disclosures or by registry evidence, and refreshed at periodic review. Simplification is withdrawn, and the file re-run at standard depth, in four situations: delisting; loss of the majority link; any C-9 trigger arising; and monitoring behaviour departing from the profile. SDD files carry the same S3 baseline and the same section 16 handover. The monitoring system does not know the file was simplified.

10 · Reliance and outsourcing

Mynta does not rely on third parties for the measures in this work procedure, in the sense of the AML Act's reliance provisions. The identity and screening vendors are outsourced tools under GOV-08, and the responsibility stays with Mynta. Information from an introducing partner may inform S3. It never replaces any step in section 6.

11 · Records and retention

The complete onboarding file is kept for five years after the business relationship ends. This covers the application, evidence, screening results, ownership documentation, memos, decisions and communications. The period extends to ten years where law requires it or a competent authority orders it. Records must be retrievable within the times set in GOV-07, and structured so that

compliance with each section 6 step can be shown item by item. Declined and abandoned applications are kept on the same basis.

The file is structured in Kompass in six parts: application and correspondence; evidence, indexed by section 6 step; screening, per person; ownership documentation and calculation; memos and assessments; decision and communications. Retrieval standard: the full file within 2 business days of a competent-authority request, any single evidence item the same day. Formats: original digital where received digitally, captures per 7.4 otherwise. Nothing is kept only in a mailbox or in local storage. The GDPR interface is GOV-07's: retention under this section is a legal obligation and comes before erasure requests for the retention period. Conflicts are handled per GOV-07, never case by case by the analyst.

12 · Deviations

No one may deviate from the prohibited list (C-6, GOV-04). Any other deviation from this work procedure requires four things before it happens: the MLRO's written approval, a stated reason, a compensating control, and an entry in the deviation register. The register records: date, file, the requirement deviated from, the reason, the compensating control, the approver, and the closure. The MLRO reviews the register quarterly and reports it to the board in the MLRO report.

A deviation is approved in advance. The same act without prior approval is an incident under GOV-02, regardless of how it turned out, and discovering one is itself a section 13 finding. Repeated deviation requests against the same requirement mean that either the requirement or the operation is wrong. That goes to SOP-25 as a proposed change, not into a growing register.

13 · Quality control

Second review: every high-risk approval, every PEP file and every S4.5 escalation receives a second review before the decision is communicated. The second reviewer is never the deciding analyst, and records the review in Kompass.

Monthly re-review: every month, 10% of low-risk approvals and 20% of medium-risk approvals are re-reviewed against this work procedure. The selection is drawn randomly and the draw is recorded.

Findings are graded in three levels. Observation: the documentation falls short of the standard, but the decision is sound. Finding: a step was not performed to standard. Critical: a decision is unsupported, or a mandatory step was skipped. A critical reopens the file and reaches the MLRO within 24 hours. A finding is corrected within the month. Observations feed the training programme.

The monthly quality-control report shows counts by grade, themes, the distribution per step, and correction status. Two consecutive months of the same theme trigger a thematic review of every open file touching that step. Repeated findings of the same kind trigger a revision of this work procedure through SOP-25.

14 · Special situations

14.1 Additions to an existing customer group

Where an applicant belongs to a group Mynta has already onboarded, group-level evidence may be reused, but only under two conditions: it meets C-1 age limits at the time of this application, and the

ownership above the joining company is unchanged. "Unchanged" is verified against current registry evidence. It is never assumed from the group file. The scope for the new company is: full S1 to S3 and S5 to S8, plus S4 from the joining company up to the first level that is already documented fresh in the group file. The joining company's risk rating is at least the group's, and higher where its own factors require it. The group file and the new file refer to each other.

14.2 Re-application after decline, exit or abandonment

The declined and abandoned registers are checked at S1. A re-application from a declined or risk-exited company, or from a company sharing UBOs with one, is owned by a senior analyst from intake. The prior file is retrieved and read before any new assessment starts. The new analysis must state, specifically, what has changed since the prior outcome. Where the prior outcome was an exit for risk, or a decline with SOP-20 relevance, the MLRO must approve before processing begins at all. Nothing about the prior assessment is revealed to the applicant at any point.

14.3 Restructuring during onboarding

Any change to the ownership structure during the process invalidates every S4 conclusion. S4 re-runs from S4.1, with fresh evidence for every affected level, and the decision clock resets. A structure that changes while under review, particularly toward spreading below the thresholds, is recorded as a red flag (Appendix F) and escalated, with the before-and-after structures documented side by side.

14.4 Withdrawal and abandonment

An applicant may withdraw at any time. The file closes as withdrawn and is kept per section 11. An application with an information request unanswered for 30 days closes as abandoned, after one recorded reminder. In both cases the analyst assesses whether the attempted relationship must be reported per SOP-20, exactly as for a decline, and the company is recorded in the abandoned register checked at S1. One pattern deserves attention: withdrawal right after a discrepancy was put to the customer. That is itself an indicator, and it is recorded for SOP-20 assessment.

15 · Country handling

A country connection means any of three things: the country of registration of any company in the ownership structure; the main place of operations; or the residence of any beneficial owner. Citizenship alone is not a connection. Residence is.

The handling follows rule C-2, which places countries in categories. Standard category: normal handling. Elevated category: closer document checks, and mandatory verification of the ownership level that decides the outcome against a second source. High-risk category: SOP-13 always, and the MLRO decides, regardless of the SOP-14 score. Prohibited country, at any level and whenever discovered: decline, per the S1.3 handling, and GOV-03 is assessed where the country overlaps a sanctions programme. If a prohibited connection is discovered after approval, that is an SOP-22 event trigger and a candidate for exit under SOP-23.

16 · Handover to monitoring: baseline data

Activation at S8.1 is blocked until every field below is written to the monitoring baseline. "Per product area" means separately for accounts and payments, card issuing, acquiring and the Crypto Service, as applicable to the products activated.

FIELD	CONTENT
Expected volume	Monthly value and count per product area, from S3.1
Transaction size	Average and maximum expected, per product area
Countries	Counterparty countries with expected shares, from S3.1 and S3.3
Currencies	Settlement and transaction currencies
Counterparty types	From S3.3, including marketplaces and other PSPs
Crypto share	Expected Crypto Service share of total activity, from Appendix E
Acquiring profile	MCC, expected chargeback rate, seasonality notes
Risk rating and flags	SOP-14 rating, C-9 triggers present, EDD reference where run
Review date	Per Appendix C intervals

17 · Systems and recording

Kompass, Mynta's case management system, is the system of record for this work procedure. Every section 6 step has a Kompass checkpoint. The checkpoint is completed, with its evidence attached, before the next step opens. Evidence uploads carry source and date per 7.4. Screening results attach through the SOP-12 integration; a manual attachment is logged as an exception to the normal flow. Decisions are taken in the Kompass workflow, at the C-6 level. An approval given by email or chat message does not exist and is invalid. The audit trail cannot be edited. Corrections are made by adding a new entry, never by changing an old one. A registry lookup performed outside Kompass is documented by an export or a capture per 7.4, and filed the same day.

18 · Training and competence

An analyst completes the KYB module of the training programme before deciding files alone, and the annual refresher after that. The training register documents both. Senior-analyst authority requires at least two years of onboarding casework and the MLRO's sign-off. Section 13 quality-control findings feed the training content through the MLRO report. If the same finding repeats for the same person, that person's solo decision authority is paused until re-training is documented.

Appendix A · Intake checklist

#	ITEM	STANDARD
1	Onboarding application, complete and signed	All fields; signatory verified in S2.2
2	UBO declaration	Template T-1; internally consistent
3	Ownership chart drawn by the customer	All levels down to natural persons
4	Registry extract, applicant	C-1: under 6 months; section 5 source
5	Share register or equivalent	Per the section 5 table
6	Registry evidence per ownership level	C-1 per level; section 7.2 standards

7	ID for signatories and, after S4, all UBOs	Section 7.1
8	Business description, purpose, expected activity	S3.1 fields complete, per product area
9	Acquiring only: MCC, website, processing history	The C-7 check must be possible from the material
10	Crypto Service only: expected volumes and counterparty types	Feeds the C-9 crypto trigger assessment

Appendix B · Discrepancy memo, required content (mirrors T-2)

- The customer and file reference, and the step where the discrepancy arose.
- The recalculated ownership structure, with the evidence reference for every link.
- The specific discrepancy: which sources disagree, and on which fact.
- The requests needed to resolve it.
- The Bolagsverket assessment: is the reporting duty triggered, and what was done.
- The analyst's assessment, kept separate from the facts.
- Sign-off fields for the senior analyst and, where applicable, the MLRO.

Appendix C · Decision and review quick reference

RISK RATING	DECIDES	SECOND REVIEW	PERIODIC REVIEW
Low	Analyst	10% monthly re-review	36 months
Medium	Senior analyst	20% monthly re-review	24 months
High	MLRO	100%, before communication	12 months
Any PEP	Authorised senior decision-maker	100%, before communication	12 months

Appendix D · Acquiring checks within KYB

These checks run inside S1 to S3 for acquiring applicants. The full underwriting standards live in SOP-15. This appendix summarises what the onboarding analyst does.

#	CHECK	STANDARD AND ACTION
1	Website exists and trades	Load the declared URL. Capture date-stamped evidence of the storefront, product pages, pricing and checkout. A parked, empty or under-construction site fails S1 completeness.
2	Business match	What the site sells must match the application and the declared MCC. A mismatch is handled per S3.2. The analyst never corrects it silently.
3	MCC against C-7	Check the declared MCC against the prohibited and conditional list. Conditional categories (licensed gambling, standard-category countries only) require the licence in the file before S7.

4	Mandatory site content	Legal entity identification, contact details, terms, refund and delivery policies must be present, and must name the applicant, not a different company.
5	Transaction-laundering signals	Watch for: pricing that does not make sense for the goods; a product set inconsistent with the volumes; checkout redirecting to third parties; site content copied from unrelated merchants. Record each, and where present treat it as a C-9 adverse indicator.
6	Processing history	Where the merchant has processed before: obtain statements or termination letters. An undisclosed prior termination discovered later is an SOP-22 event trigger.
7	Chargeback expectations	Record the expected chargeback rate against the SOP-15 thresholds. Sectors with structurally high rates set the monitoring baseline accordingly.

Appendix E · Crypto Service assessment within KYB

For business customers requesting the Crypto Service through Mynta Digital AB, the analyst does four things. Record the expected crypto volumes and their share of total expected activity; the C-9 trigger sits at 30%. Identify the customer's own crypto touchpoints at declaration level: exchange accounts, self-hosted wallets, VASP counterparties. Confirm the requested tokens are on the C-8 approved list. Note the boundary: wallet screening at transaction level and travel-rule handling are SOP-17 controls, not onboarding controls. Access is activated as a separate product flag at S8.1, never by default.

Appendix F · Red-flag catalogue

These are indicators the analyst records when observed. A recorded flag routes the file per its action column. It does not decide the outcome. "Escalate" means S4.5-style memo handling. "EDD" means the C-9 route to SOP-13.

FLAG	SEEN AT	ACTION
Declaration names no UBO while the ownership structure is shallow and concentrated	S4.1	Recalculate first; discrepancy handling if the arithmetic disagrees
Registry evidence too old only for the level that decides the outcome	S4.4	Request fresh evidence; do not proceed on the outdated level
Ownership restructured shortly before the application	S4	Obtain the prior structure; assess the purpose; EDD where unexplained
Ownership structure runs through a country with no accessible registry	S4.4	Alternative evidence per 7.2; C-9 complex-structure trigger
Nominee or bearer-share indications	S4	Escalate; outside appetite unless resolved with full transparency
Signatory unconnected to the company in any registry	S2.2	Authority evidence per 7.3, or the file is incomplete
Virtual office plus no operating address plus immediate high volumes	S2.4, S3.2	Memo per S3.2; escalate

Expected volumes without history, funding or staff to support them	S3.2	Memo per S3.2; escalate
Sector mismatch between the registry purpose code and the stated business	S2.3, S3.1	Clarify; an unresolved mismatch escalates
Near-match dismissed on the customer's own word only	S5.2	Never accepted; the decision follows the C-4 evidence rules
Adverse media in designated categories on any person in the structure	S5.3	EDD
Reluctance to provide source documents combined with pressure for fast activation	Any	Record; escalate on repetition; never a reason to skip a step
Requested products do not match the business (acquiring for a holding company)	S3.1	Clarify; an unresolved mismatch escalates
Crypto share dominating expected activity for a non-crypto business	S3.3, App E	EDD vithe C-9 crypto trigger
Prior acquiring termination discovered rather than disclosed	App D	Escalate; assess SOP-20 relevance
Documents professionally prepared but inconsistent on dates or names	Any	Treat as a discrepancy; S4.5 handling

Appendix G · Worked example: complete versus defective file

Applicant: Lagerkrans Interiör AB, a Swedish AB selling furniture online, applying for an account and acquiring. A complete file at S1 looks like this. The application is signed by the registered signatory. T-1 declares one UBO at 100%. The chart matches. The Bolagsverket e-extract is dated within C-1. The aktiebok names the UBO. The signatory-UBO is verified with BankID. The business description states expected volumes per product area. The MCC is 5712, with a live website passing Appendix D checks 1 to 5. The file proceeds to S2 the same day.

Now the same file with three typical defects, and the required handling. First: the extract is 8 months old. The item fails C-1. Request fresh evidence, pause the clock, and do not begin the assessment (S1.2). Second: the aktiebok names two holders at 50% each, while T-1 declares one at 100%. That is a discrepancy on an ownership fact. S4.5 applies in full: memo per T-2, no proceeding, no declining, and no silent correction, even though the fix seems obvious. Third: expected acquiring volume of SEK 4m per month, with no trading history and a website created last month. That is not reasonable, and S3.2 applies. Document it and escalate with the file. Do not resolve it by taking the customer's word.

Each defect is handled by the step that owns it. Putting the requests into one message to the customer is fine. Deciding anything before the defects are resolved is not.
