

SOP-12: PEP and sanctions screening routine

Company	Mynta AB
Last approval date	2026-09-10
Approved by	MLRO
Document type	Work procedure
Document owner	Screening function
Information class	Open internally, confidential externally

Versioning

DATE	VERSION	CHANGES	BY
2026-09-07	1.x	Earlier versions per the change notes in this document	Document owner
2026-09-10	2.0	Rewritten in plain language. No rules changed.	Document owner

FIELD	VALUE
Implements	GOV-02 §7, GOV-03; rules C-4, C-5
Interfaces	SOP-10/11 (referrals in), SOP-13 (EDD out), SOP-19 (escalation), SOP-21 (freeze), SOP-17 (wallets), SOP-18 (transaction-level)

1 · Purpose and scope

This routine sets how persons and entities connected to Mynta are screened against sanctions lists, PEP data and adverse media, and how matches are decided. The designated adverse-media categories cover money laundering, terrorist financing, sanctions evasion, corruption, tax crime, fraud, cybercrime, trafficking and other serious predicate offences; the set may be expanded risk-based, with the expansion recorded. It covers three things. Name screening at onboarding. Ongoing and event-driven screening of the existing customer base. And the standard for deciding on hits used everywhere, including for transaction-level hits routed from SOP-18 and wallet hits routed from SOP-17. Two things are out of scope. Who must be screened in a given case is set by the referring routine, on the identified-not-declared rule. Screening beyond the required population is personal-data processing without an automatic legal ground: it requires control indications or an approved deviation, and is never run just to be safe. The freeze itself is governed by SOP-21.

2 · Lists and data in scope

CATEGORY	CONTENT	GOVERNANCE
Sanctions	EU consolidated list, UN as implemented in EU law, Swedish national measures, plus the OFAC programmes designated in the C-registers per GOV-03 §2	Updates applied without undue delay from the moment they take legal effect, weekends included: same-day loading, blocking on too-old lists, and re-screening of the full customer base after every

update; confirmed sanctions matches are reviewed without delay, weekends included, and other update hits within one business day; application documented in the update log

PEP	Vendor PEP database covering the penningtvättslagen function list, family members and known close associates, run against the entire customer base daily, with 18-month post-function retention treated as in scope	Vendor coverage reviewed annually against the SOP-10 §8 function list
Adverse media	Designated categories only: money laundering, terrorist financing, fraud, corruption, organised crime, sanctions evasion	Category set is rule-registered; screening outside the designated set shall not be performed

3 · Definitions

Hit	Any vendor-generated potential match at or above the C-4 similarity threshold (85%).
Secondary identifiers	Date of birth, nationality or country of registration, identifiers such as personnummer or org.nr, and address, in that order of weight.
Dismiss	A recorded determination that a hit is not the listed person, on the C-4 evidence standard.
True match	A hit confirmed as the listed person or entity, or one that cannot be dismissed on evidence.
Delta screening	Re-screening the full active base against list changes upon every update.

4 · When screening runs

- S1.1 Onboarding: every person and entity referred by SOP-10 S5.1 or SOP-11, before any product activation. The file is not complete until the screening results are on it.
- S1.2 Ongoing: delta screening of the full active base on every list update, within the GOV-03 SLA; results first sortingd the same day for sanctions deltas.
- S1.3 Event-driven: whenever a routine identifies a new person in a relationship (ownership change, new signatory, SOP-22 findings), that person is screened before the event assessment closes.
- S1.4 Transaction-level: payment counterparty hits from SOP-18 and wallet hits from SOP-17 arrive as the decision on hits referrals and follow sections 5 and 6 with sanctions timing.

5 · Decision on hits

- S2.1 Every hit is decided individually; batch dismissing by pattern is prohibited. The person deciding works from the hit record, the person's file data and, where needed, registry evidence, never from customer assurances.
- S2.2 Dismiss at first line IF the identifier evidence is strong enough: one strong mismatch, such as date of birth against a verified document, may be sufficient, while two weak mismatches may not be. The strength assessment and the rationale are recorded per hit. One weak mismatched identifier alone never suffices; name-only similarity with no secondary data shall be escalated, not dismissed.
- S2.3 IF a sanctions hit cannot be dismissed on S2.2's standard, THEN treat it as a true match immediately. SOP-21 applies at once. The relationship is suspended, and the customer is not notified. Analysis continues after the freeze. That ordering comes from GOV-03 §8.
- S2.4 IF a PEP hit is confirmed or cannot be dismissed, THEN the referring file re-routes per SOP-10 §8: high risk, SOP-13 measures, MLRO authority. A customer's denial of PEP status against a confirmed function match is a discrepancy, not a dismiss.
- S2.5 IF an adverse-media hit in a designated category is confirmed as the person, THEN route to SOP-13 per C-9; record the credibility of the source and how specific the allegation is. That assessment belongs to the EDD scoping. It is not a reason to drop the hit at screening.
- S2.6 Escalation: any decision on hits the first line cannot close on evidence goes to the screening specialist; sanctions doubt goes to the MLRO with SOP-21 already applied. Timelines per C-5: sanctions immediate, PEP and adverse media within 3 business days.

6 · Recording

Keep one record per screened person. It contains: the lists and list versions screened against, the date and vendor reference, every hit with its decision, reason and decision-maker, and the person's current net status. This record is what SOP-10 S5.4 files and what QC samples. If a person's screening status cannot be read in one place, that person counts as unscreened for decision purposes.

7 · System governance

Threshold and fuzzy-matching configuration implements C-4 and changes only through recorded change control with before-and-after test evidence. Annual effectiveness testing covers list coverage, update latency, known-entity seeding (planted test names must hit), and dismiss-quality re-review of a random selection: 5% of first-line dismiss re-reviewed monthly by the screening specialist, findings graded per the SOP-10 §13 scale. Before any tuning that reduces hit volume is approved, its effect on recall shall be tested and recorded.

8 · Records and review

Records per GOV-02 §10. This routine is reviewed annually, on vendor or configuration change, and on GOV-03 revisions.
