

SOP-14: Customer risk scoring methodology

Validation: the model is validated annually, including back-testing against decided files. Overrides are MLRO-approved and entered in the override register, and systematic override pressure on any factor triggers a model review through SOP-25.

2026-09-10	2.0	Rewritten in plain language. No rules changed.	Document owner

FIELD	VALUE
Implements	GOV-02 §6; must reconcile to GOV-01 per its conclusion C8
Consumed by	SOP-10 S6, SOP-11, SOP-13 depth, SOP-18 intensity, SOP-22 intervals, C-6 authority

1 · Purpose and principles

The score turns GOV-01's institutional risk understanding into a per-customer classification: low, medium or high. The classification drives verification depth, decision authority, monitoring intensity and review frequency. It must therefore be reproducible: same inputs, same class, no matter who computes it. That is why the factors, values and arithmetic are fixed in this document and recorded per customer (SOP-10 S6.3). Judgement is applied through the override mechanism in section 5. Ad hoc re-weighting of factors at the desk is prohibited.

2 · Structure

The model is an additive factor score, with mandatory-high triggers on top. It works in four steps. Each factor takes the points of its highest applicable row. The factor points are added into a raw score. The raw score maps to a class through the bands in section 4. The mandatory triggers then force high, regardless of the arithmetic. There is no channel factor. Distribution is remote for every customer (GOV-01 §8), and a factor that is the same for everyone separates no one.

3 · Factors and values

FACTOR	VALUES	POINTS
--------	--------	--------

Customer type	Consumer · Simple domestic/EEA legal person · Legal person with foreign layer · Regulated FI or licensed MSB/VASP counterparty-customer	0 · 4 · 8 · 10
Ownership complexity	Direct natural-person ownership · 2 layers · 3+ layers or any legal-arrangement layer	0 · 6 · 12
Geography, worst applicable connection (C-2)	the standard category · the elevated category · the high-risk category	0 · 8 · 16
Products held	Accounts/cards only · plus acquiring · plus crypto access	0 · 8 · 8
Industry (business customers)	Standard · Elevated-typology sector (cash-intensive trade, high-value goods, C-7 conditional categories)	0 · 8
Expected activity vs segment norm	Within norm · Above norm with support · Above norm unsupported (also S3.2 handling)	0 · 4 · 10
Crypto share of expected activity	None · Under 30% · 30% or more (also C-9 trigger)	0 · 4 · 10
History (at review only)	Clean cycle · TM findings or SOP-22 events in cycle	0 · 8

4 · Bands and mandatory triggers

CLASS	RAW SCORE	CONSEQUENCES
Low	0-11	Analyst authority; 36-month review; standard monitoring
Medium	12-27	Senior-analyst authority; 24-month review; standard-plus monitoring
High	28+	MLRO authority; 12-month review; enhanced monitoring; SOP-13 as scoped

Mandatory high regardless of score: any PEP connection per SOP-10 §8; any high-risk-category connection; any confirmed designated adverse media; any C-9 trigger not already carried by a factor; and any case where GOV-01 rates the customer's defining feature high while the arithmetic lands lower. That last rule is the reconciliation that GOV-01 conclusion C8 requires. Every mandatory-high entry records which trigger fired.

5 · Overrides

Only downward overrides need this process, and they are rare by design. A downward override requires four things: MLRO approval; a written rationale explaining why the triggering factor overstates this customer's risk; an entry in the override register; and a 12-month review cycle, regardless of the resulting class. Upward judgement is not an override. Any analyst may classify above the arithmetic, with the reason recorded. If overrides keep hitting the same factor, that factor goes into the section 7 validation, per GOV-01 C8. The model shall be corrected on evidence; classifications shall not be adjusted to fit the model.

6 · Worked example

Halvix-pattern applicant: foreign-layer legal person (8), two-layer ownership structure at declaration but three effective layers once recalculated (12), the elevated category connection through the Estonian holdco (8), applying for accounts and acquiring (8), standard industry (0), expected activity above norm with partial support (4), no crypto (0). Raw score 40: high, before any trigger. The MLRO decides. In this pattern, the S4.5 discrepancy handling is already running for its own reasons. The score shall be computed on the facts as established under SOP-10 S4, not on the customer's declaration.

7 · Validation and change control

Annually, and after material GOV-01 revisions: factor and band performance is validated against outcomes, class distribution across the book, escalation and SAR rates per class, override frequency and direction, and misclassification found in QC. Bands should separate outcomes; a model whose high class contains no more findings than its medium class is recalibrated. Changes to factors, values or bands go through recorded change control with a GOV-01 basis stated, apply prospectively, and trigger rescoring of affected segments at their next review, or immediately where the change closes an identified gap.
